# INTRODUCTION

## OVERVIEW

The purpose of this guide is to help technicians and engineers integrate Yaskawa Variable Frequency Drives (VFD) into a new or existing EtherNet/IP network, specifically Rockwell Automation (RA) Programmable Logic Controllers (PLC). EtherNet/IP (EIP) is being used in a wide range of industries and is one of the fastest growing industrial protocols in the United States. EtherNet/IP is an open source implementation, thus allowing for the continuous development and support from industry leaders (such as Yaskawa), ensuring that this industrial application layer protocol support sustainability.

Instructions and examples will be based on Yaskawa Tag Generator, Yaskawa add-on instructions, RSLINX, and a Compact/ControlLogix™ PLC platform, configured with the RSLogix 5000 or Studio 5000 (RS5K) software environment. This guide will navigate, configure and explore the functionality of Yaskawa Tag Generator.

The Yaskawa Tag Generator was developed to allow technicians and engineers to select multiple Yaskawa EtherNet/IP products, their functions (pre-defined I/O assemblies), and then output the compiled data to a Comma Separated Value (CSV) file. Once imported into the RS5K environment, these tags are then aliased to generic tags created when adding the Yaskawa module[s], thus simplifying integration and reducing commissioning time.

## USE OF THIS INFORMATION/ DOCUMENTATION

Nothing in this document or any information or data derived from this document may be published, distributed or copied, nor may the information or data be used to create derivative works. No user of this information or data may allow or enable others to reverse engineer, decompile, disassemble or otherwise attempt to reconstruct, identify or discover any code, underlying ideas, techniques, or algorithms from this information. No confidential information or proprietary rights or data may be removed, obscured or altered.

All proprietary and ownership rights belonging to EECO shall remain with EECO, and nothing in this document shall relinquish such rights, title or interest.

## INDEMNIFICATION

EECO shall be indemnified and held harmless from any and all claims, damages, losses and/or expenses, including reasonable attorney's fees arising from any breach of this agreement or the user's obligations hereunder.

## WARRANTY DISCLAIMER

This document is to be used “As Is” without warranty of any kind. EECO, on behalf of itself and any affiliates, hereby disclaims all representations, promises or warranties, whether express or implied with respect to the information contained herein. EECO specifically disclaims all implied warranties or merchantability, non-infringement, suitability and fitness for any purpose.

## PRE-REQUISITE SKILLS

This document is written and intended for technicians and engineers who will be commissioning and/or supporting Yaskawa VFD[s] on the plant floor. The intended users should understand, at the very least, navigation through the RS5K software environment.

## REQUIRED HARDWARE/SOFTWARE

1. Yaskawa VFD with Optional Communication Card- (CIMR-VU2A0001FAA - V1000 with the SI-EN3/V in our case)
2. PC with RSLINX and RS5K
3. Rockwell Logix PLC (1756-L71 ControlLogix in our case)

*\* Note: All Yaskawa EDS files and software may be downloaded from [Yaskawa.com](http://Yaskawa.com) via links provided in the Appendices.*

## COMMUNICATION

### VFD COMM METHODS

Initial connection to the Yaskawa VFD can be accomplished in a couple of ways:

1. Direct connect via PLC to VFD
2. Common Switch or Router Connect via ports on the same switch
3. Network connection via multiple switches and/or wireless access points

### VFD DEFAULT CONFIGURATION AND PREPARATIONS

Open DeviceNet Vendor Association (ODVA), the governing body of EtherNet/IP, which specifies that all EIP supporting devices, including Yaskawa VFD, by default must be set to use Dynamic Host Controller Protocol (DHCP) to get the network settings.

This corresponding requirement is reflected in parameter F7-13 (Address Mode at Startup: 2 by default). If a DHCP server does not exist within the network topology, proceed to change the network settings manually to a static setting.

Using the keypad or Drive Wizard Industrial software, the option card's network settings (IP Address, Subnet Mask and Default Gateway) can be configured under the F7 parameters. Additional User Setting Table information can be found within the Yaskawa AC Drive Technical Manual – SIEPC71060618: E.3 – page 491.

### YASKAWA VFD NETWORK PARAMETERS:

- F7-01 Ethernet IP Address 1 — 192
- F7-02 Ethernet IP Address 2 — 168
- F7-03 Ethernet IP Address 3 — 1
- F7-04 Ethernet IP Address 4 — 1-254
- F7-05 Subnet Mask 1 — 255
- F7-06 Subnet Mask 2 — 255
- F7-07 Subnet Mask 3 — 255
- F7-08 Subnet Mask 4 — 0
- F7-09 Gateway Address 1 — 192
- F7-10 Gateway Address 2 — 168
- F7-11 Gateway Address 3 — 1
- F7-12 Gateway Address 4 — 1
- F7-13 Address Mode at Startup — 0 from 2 to become static, then cycle power.

To confirm network settings after the power cycle, we can verify the settings under the Monitor parameters U6-80 to U6-91. Values are preset if the option card has a connection to another device.

The network LED (NS) should now transition to a solid green state.

### ENABLE COMM CONTROLS CONFIGURATION

The following parameters must be changed to enable fieldbus controls.

- B1-01 to 3: Option PCB (Frequency Reference Selection 1) Default is = 1 Analog Input
- B1-02 to 3: Option PCB (Run Command Selection 1) Default is = 1 Digital Input

*\*New values will accept immediately without a Power Cycle*

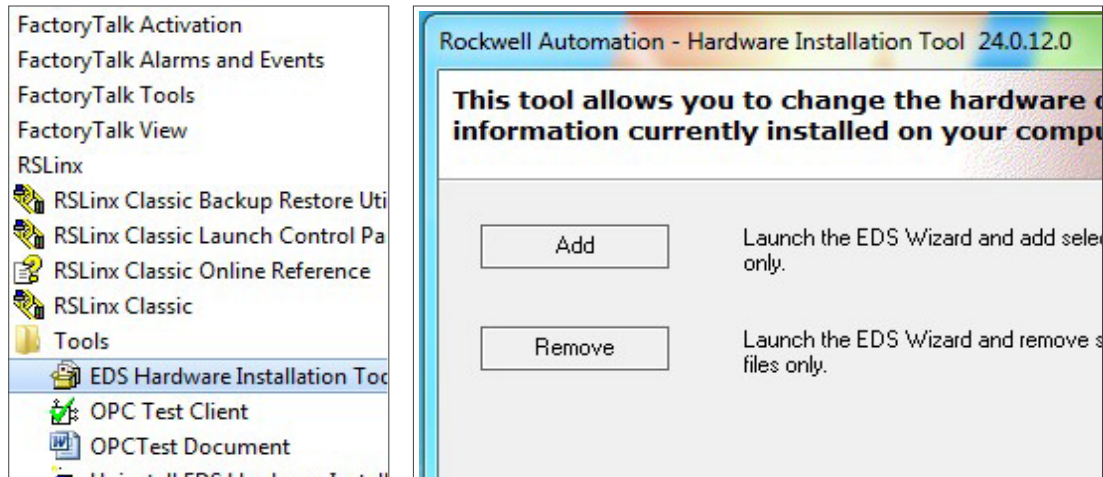

### PC CONFIGURATION

1. Open **Network and Sharing Center** from the task bar or under Control Panel.
2. If no connection is present on your PC network port (RJ45), select **change adapter settings** on the left side bar.
3. Double click **Local Area Connection**, then **properties**, and double click on **(TCP/IPv4)**
4. Configure the PC's static network settings by selecting **"Use the following IP Address:"**
5. Input an **unused IP Address** that is on the same subnet as previously mentioned in the VFD configured option.
6. Input the same **Subnet mask** and **Default Gateway** as previously used in the VFD configuration.
7. Select **OK** and **OK** again on the Local Area Connection Properties window and the settings are ready.

A solid vertical green line is positioned to the left of the text.

ROCKWELL AUTOMATION  
ENVIRONMENT

**RSLINX**

Let's start off by registering the EATON EDS files into RSLINX with the EDS Wizard.

Open the start menu and under RSLINX

**STEP 1:** Select the **EDS Hardware Installation Tool**

**STEP 2:** Select **add**

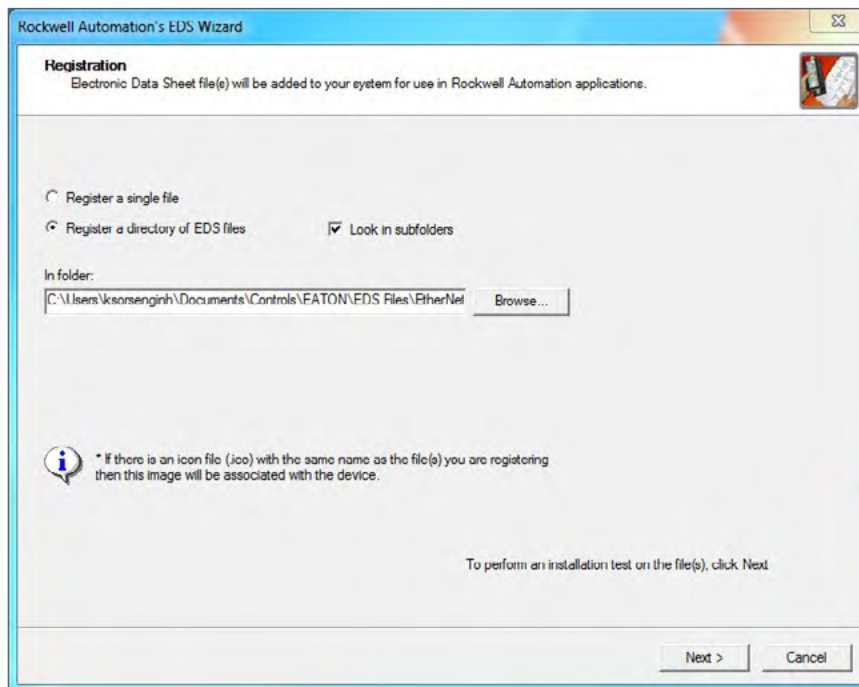

Beginning with **v20 of RS5K**, this may be accomplished with other additional options within the environment under the **Tools Menu**.

Select whether you would like to register a single or a directory of EDS files. If the latter, please tick **Look in subfolders** as well.

**STEP 3:** Browse to the folder directory containing the EDS[s]

**STEP 4:** Click **next**

The system will do a scan and *populate a test result*.

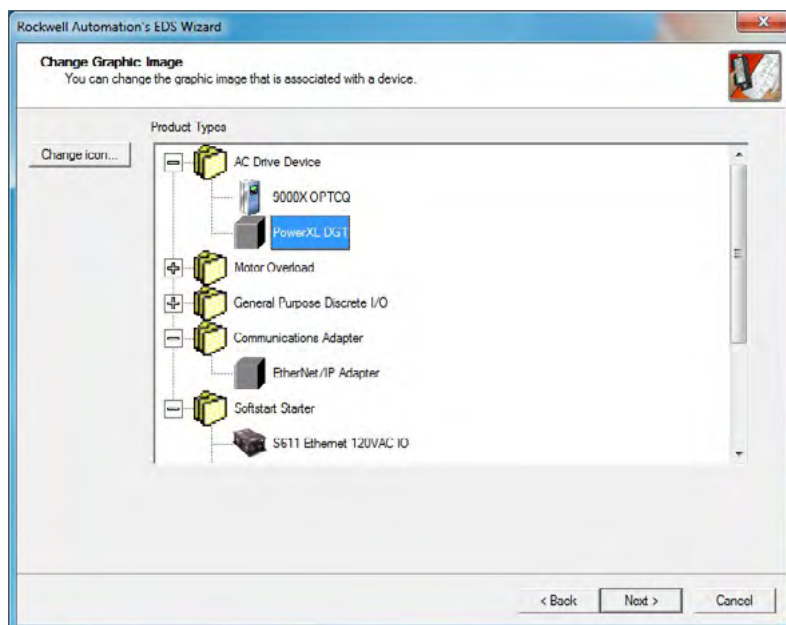

**STEP 5:** Select the desired file[s] to register

**STEP 6:** Click **next**

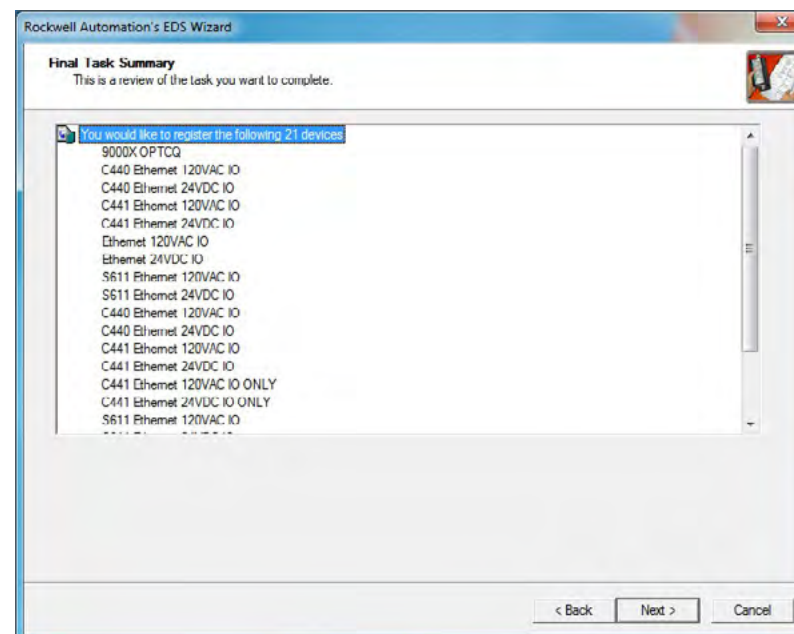

**Change the icons** if needed

**STEP 7:** Click **next**

A final task summary window will appear. *Ensure the information is correct.*

**STEP 8:** Click **next** to complete the EDS registration process

A solid green vertical bar positioned to the left of the text.

# STUDIO 5000

## **PART 1**

**STEP 1:** Open or create a new project in RS5K.

If starting a new project -

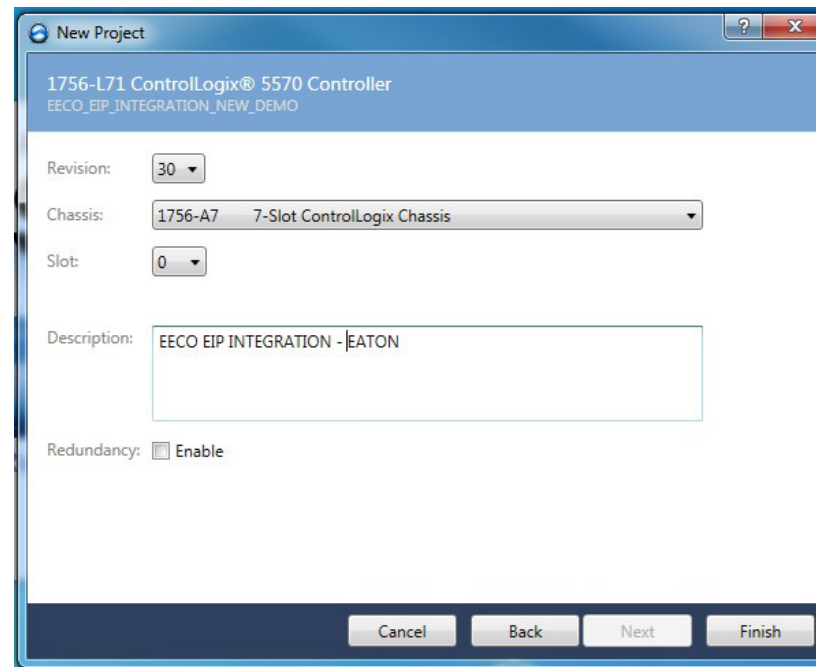

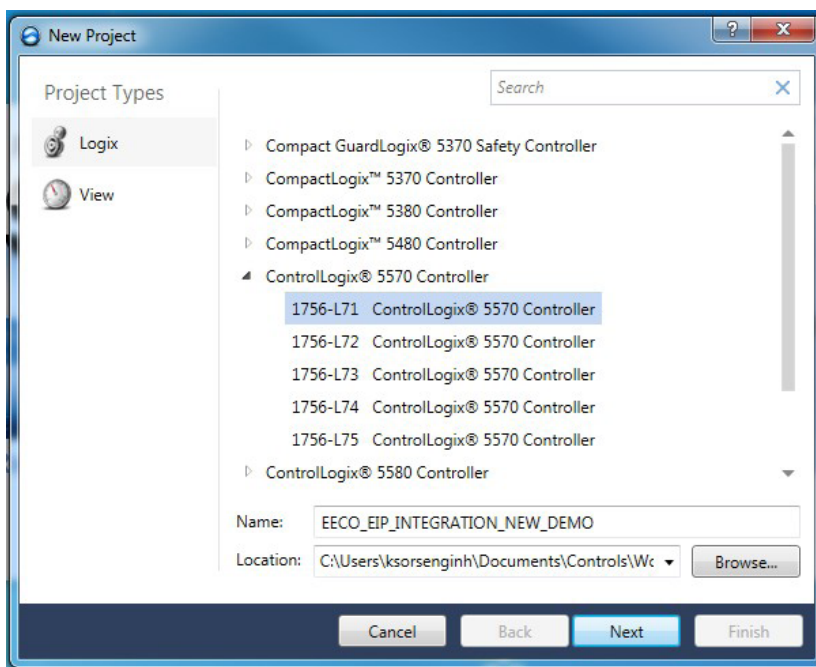

**STEP 2:** Select the processor and name your project

**STEP 3:** Browse to the desired project save location

**STEP 4:** Click next

**STEP 5:** Select the chassis type

**STEP 6:** Click finish

In the Controller Organizer -

**STEP 7:** Right click the processor Backplane (slot 0)

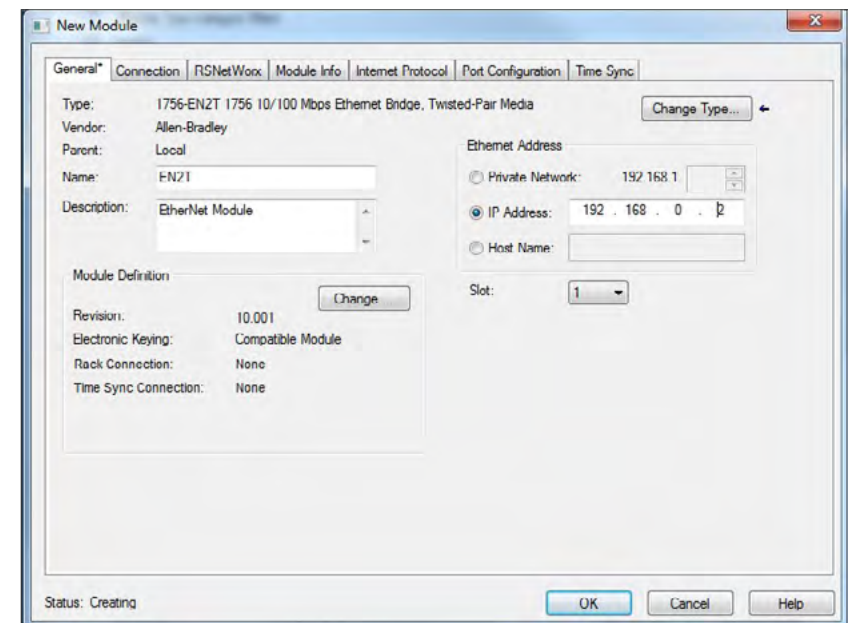

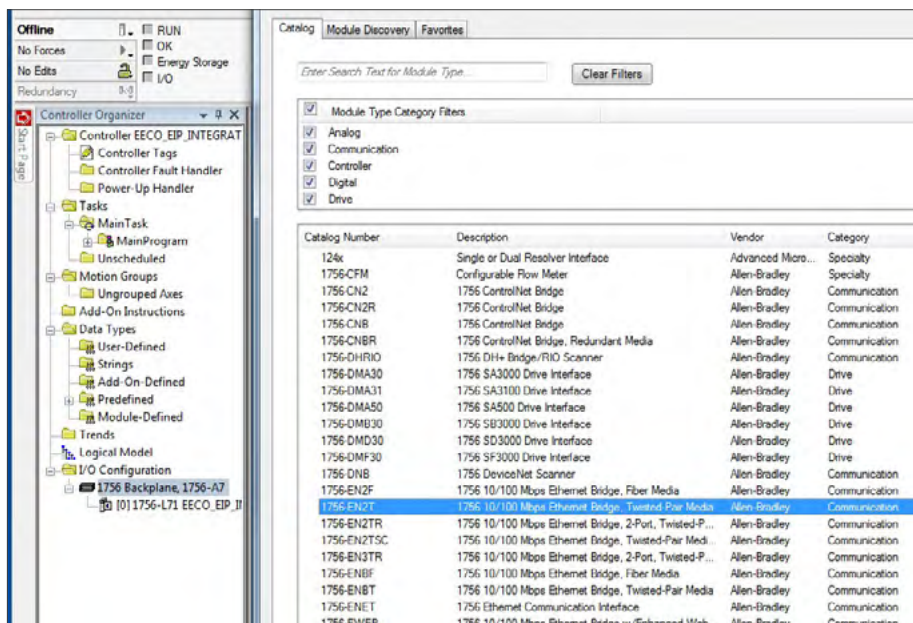

**STEP 8:** Create a new Ethernet module.

For this example, the 1756-EN2T will be used. Click **create**

**STEP 9:** Name the EN2T and input an unused IP Address (192.168.0.2)

**STEP 10:** Click **OK**

An EN2T module (slot 1) now exists under the *Backplane*.

A Yaskawa V1000 VFD will be added to the RS5K project.

**STEP 11:** Right click on the **1756-EN2T** module and **select create new module**

The Select Module Type window appears. To enter the V1000 as a Generic Ethernet Module -

**STEP 12:** **Deselect both filters** for Category and Vendor

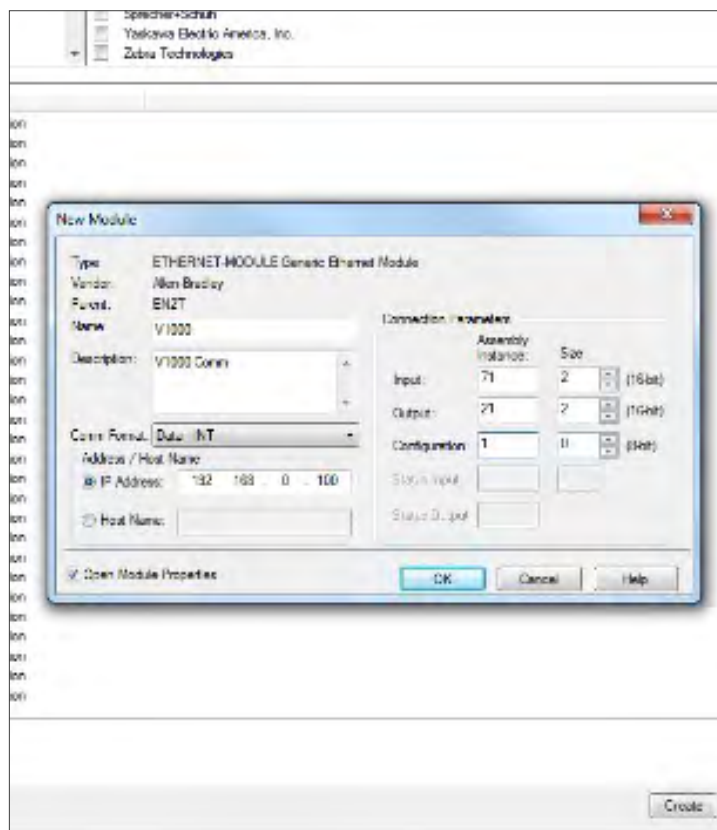

**STEP 13:** Select only **Communication** and **Allen Bradley**

**STEP 14:** Scroll down toward the bottom of the list and **select ETHERNET-MODULE Generic Ethernet Module**

**STEP 15:** Click **create**

**STEP 16:** A new module window appears

- STEP 17:** Input a name that is distinctive yet simple (**V1000**) as you will need to reuse this identical name in the Tag Generator Software
- STEP 18:** Change the Comm Format from **DINT >> INT**
- STEP 19:** Input an unused IP Address (**192.168.0.100**) that is on the same subnet as the EN2T, i.e. 192.168.0.x. {x = 2-254}.
- STEP 20:** Input **71** for the Input Assembly Instance, **size = 2 bytes (INT)** (pg. 41 in TOBPC73060092 Manual)
- STEP 21:** Input **21** for the Output Assembly Instance, **size= 2 bytes (INT)** (pg. 41 in TOBPC73060092 Manual)
- STEP 22:** Configuration assembly is not used, but there must be a value there as a place holder so input **1 for Configuration** Assembly Instance, **size = 0**

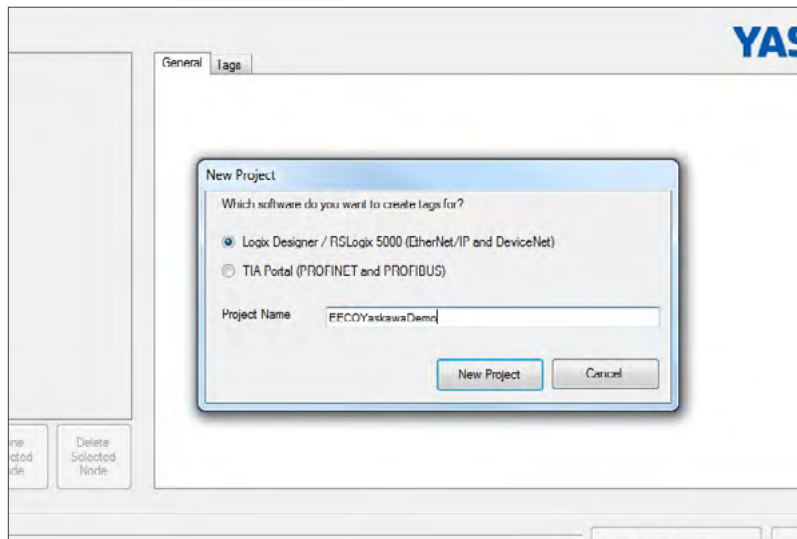

A solid green vertical bar positioned to the left of the text.

# YASKAWA TAG GENERATOR

**STEP 1:** Install Yaskawa Tag Generator. Once installed, start the program by **double clicking the icon**

**STEP 2:** Click New Project in the top menu.

The new project window will pop up and ask which software do you want to create tags for.

**STEP 3:** Tick **Logix Designer/RSLogix 5000**

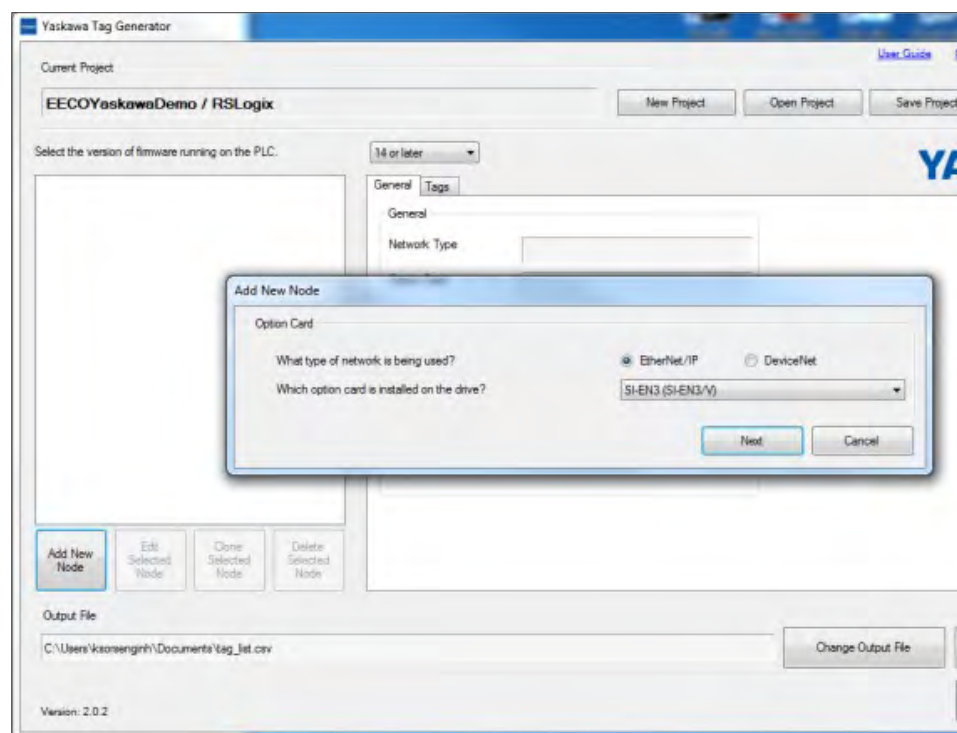

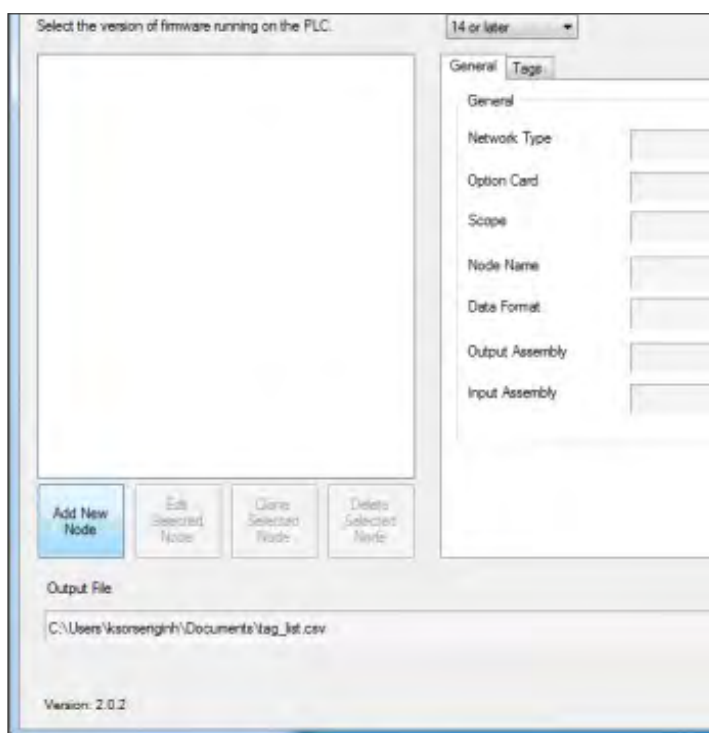

**STEP 4:** Enter a project name and click **New Project** to create the project.

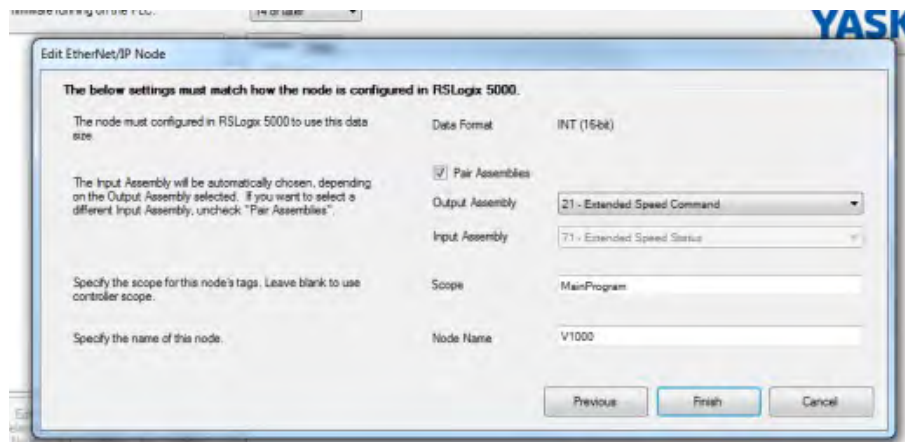

Once the project is created, select which firmware is running on the PLC.

**STEP 5:** Click **Add New Node**

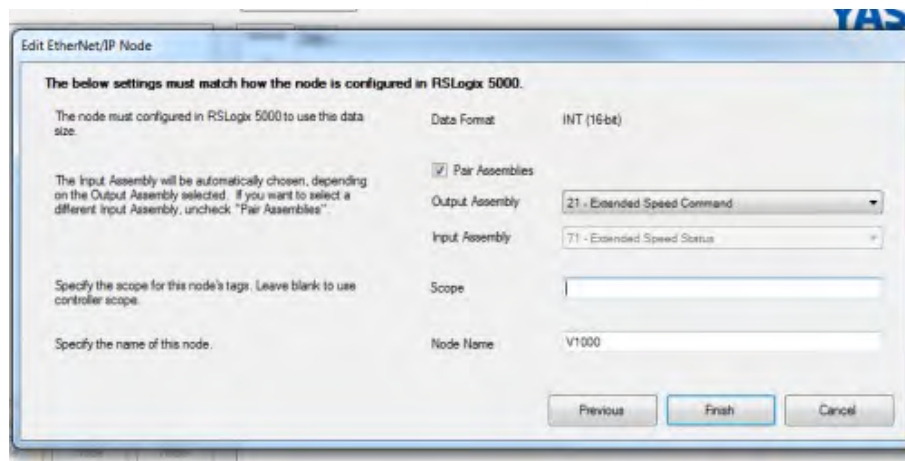

**STEP 6:** Select the **Option Card** on the next window

**STEP 7:** Click **next**

**STEP 8:** Select the I/O Assembly pair that was used in the RS5K project **(21-71)**

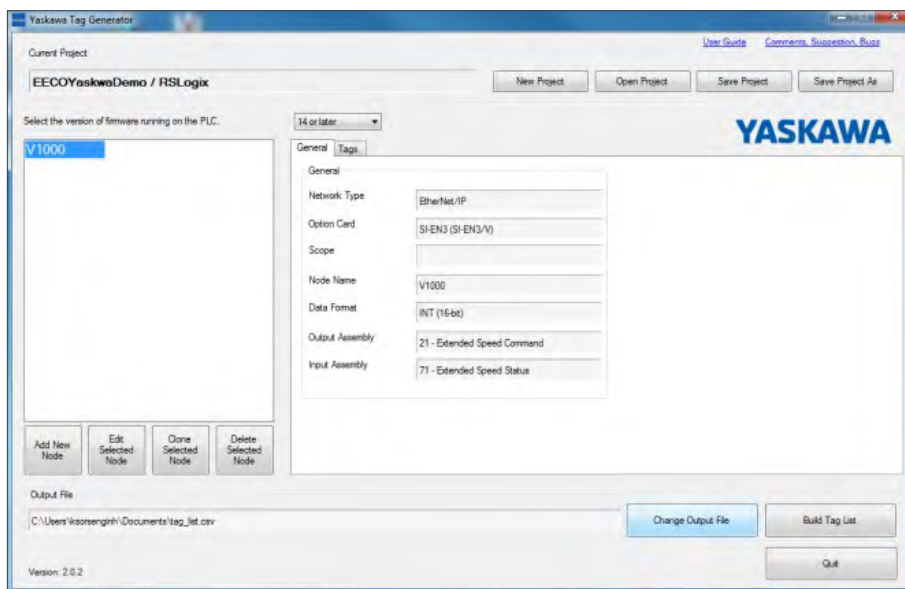

**STEP 9:** Delete the Scope field to make the tags accessible globally; otherwise, they will only be available in MainProgram

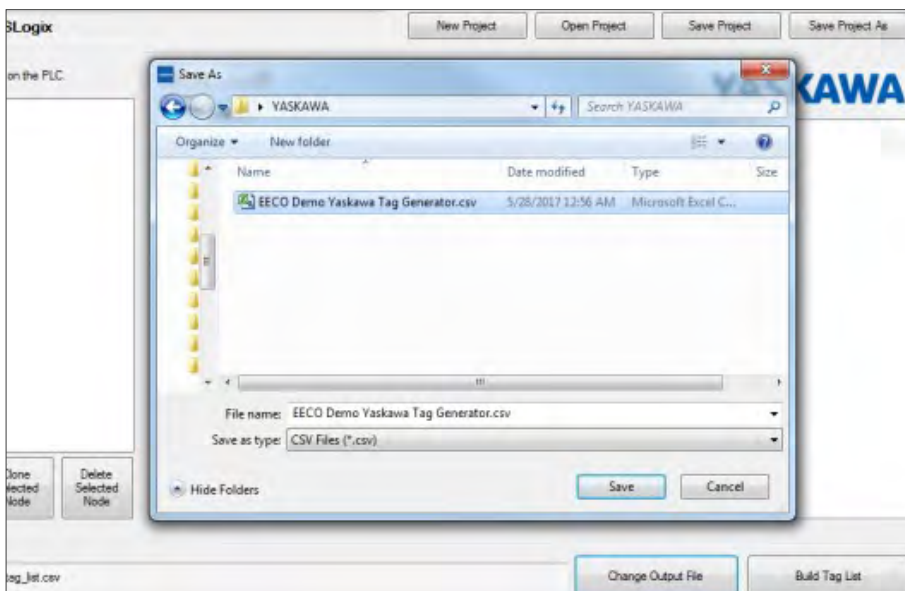

**STEP 10:** Enter a node name, V1000 in this case

**\*(MUST BE AN IDENTICAL NAME USED IN RS5K).**

**STEP 11:** Click **finish**

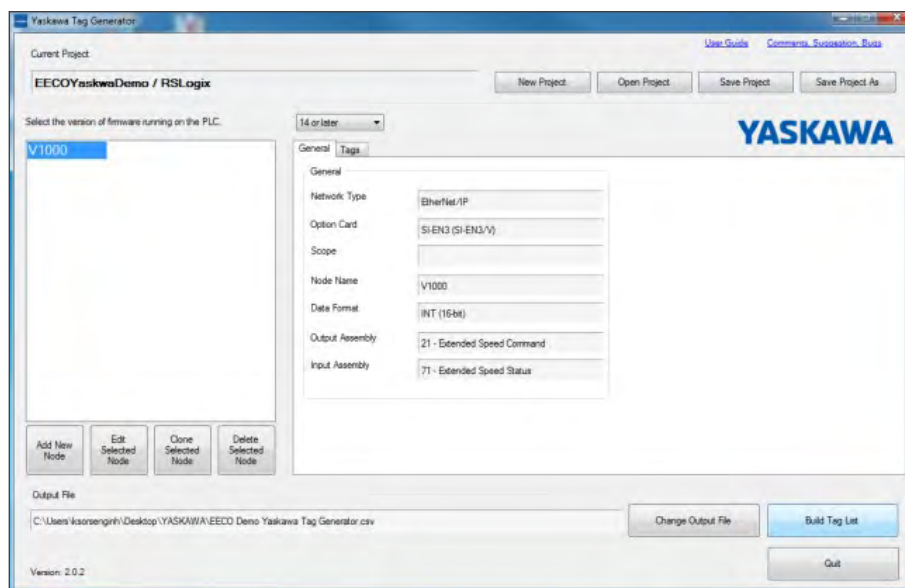

**STEP 12:** Click **Change Output File** and browse to a file location to save the CSV output file

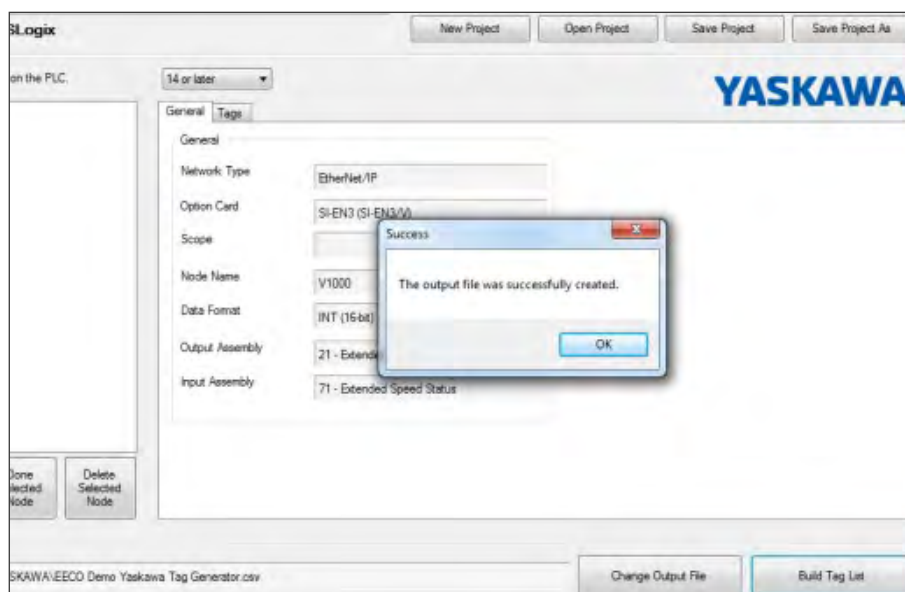

**STEP 13:** Name CSV file

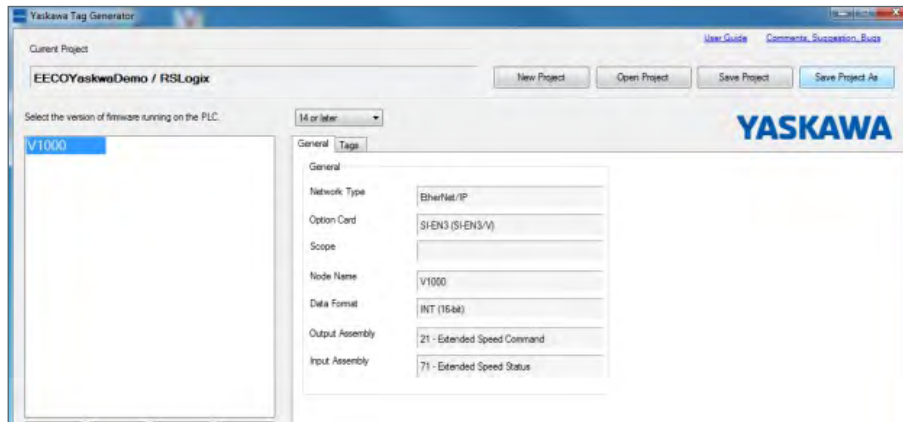

**STEP 14:** Click **save**

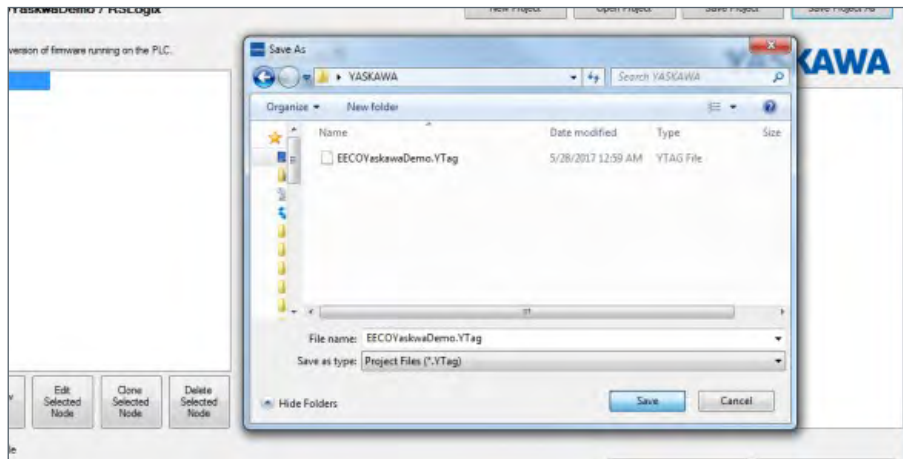

**STEP 15:** Click **Build Tag List** to generate

**STEP 16:** Click **OK** in the notification pop-up

**STEP 16:** Click **Save Project As**

**STEP 17:** Provide a name for the project in the pop-up window

**STEP 18:** Click **Save**

**STEP 19:** The project may now be accessed at a later time for modification.

**STEP 20:** Click **Quit** and the task is completed.

The remaining task will be completed in the RS5K environment.

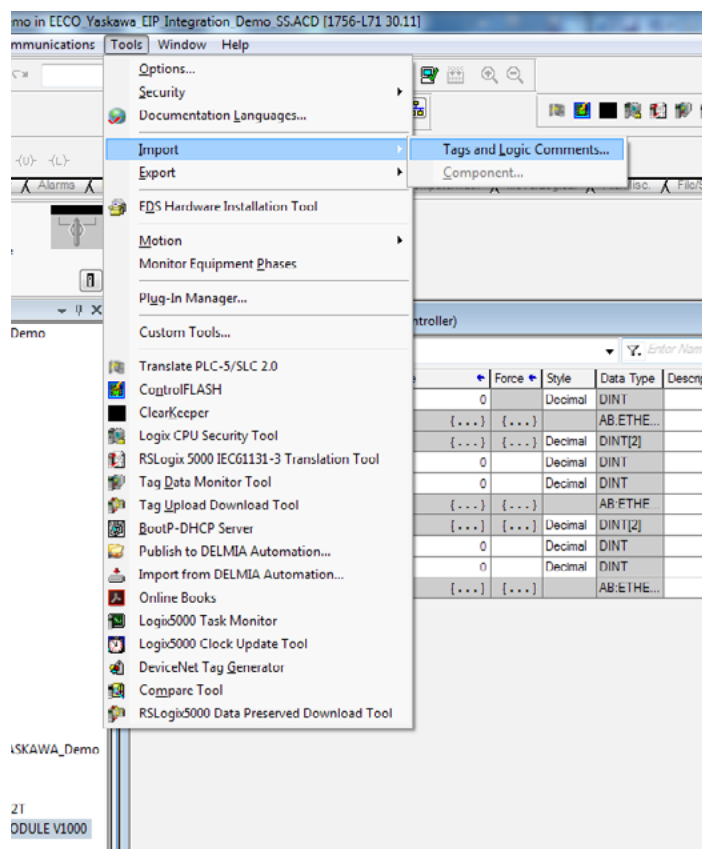

# STUDIO 5000

## **PART 2**

Navigate back to the RS5K environment -

**STEP 1:** Go to the **Tools Menu > Import > Tags and Logic Comments**

**STEP 2:** Browse to the previously saved CSV folder location, **select**, and **import**

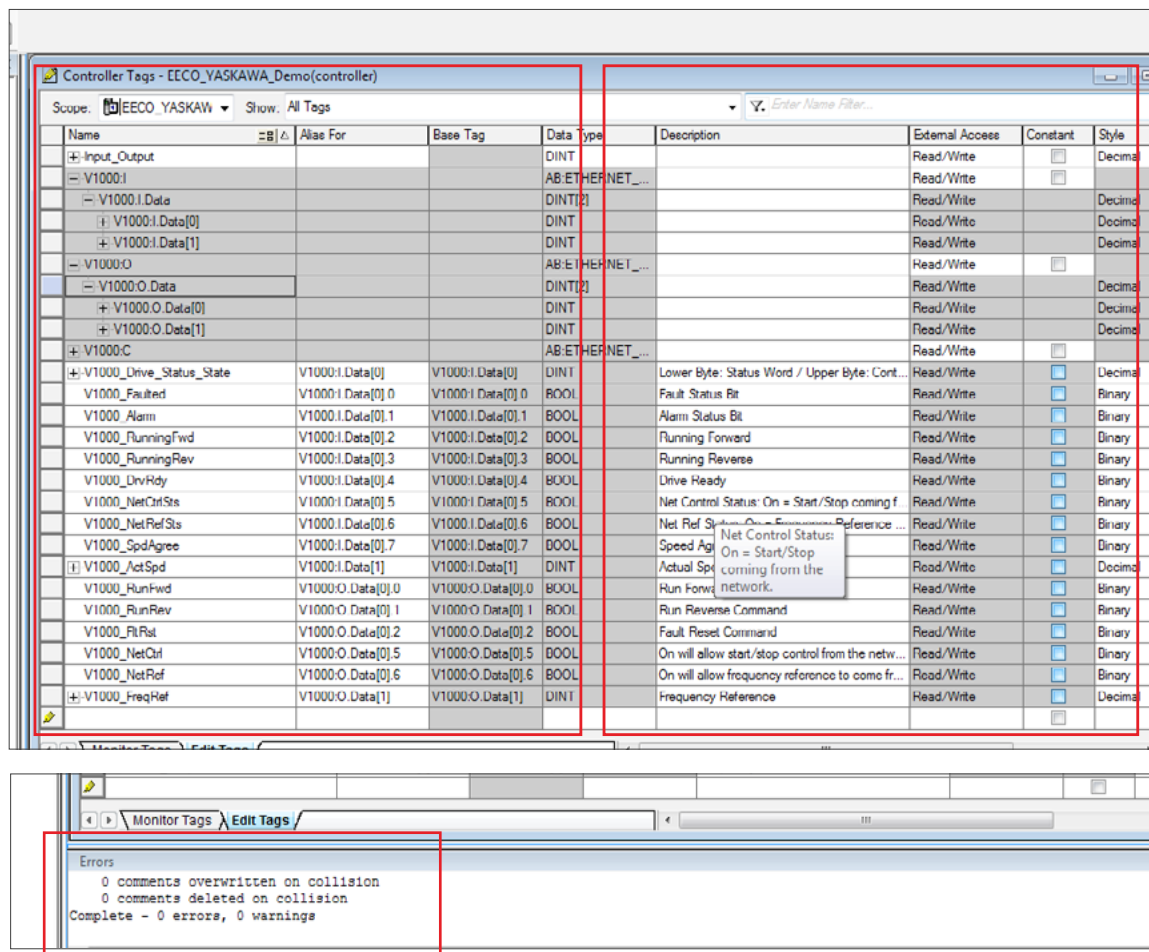

Once the import task is completed, you will notice that the lower Error plane provides feedback on how many tags were created, in addition to any errors and warnings.

**\*If there are error[s], ensure that the names specified in the RS5K project and Yaskawa Tag Generator were identical, or re-run Tag Generator with the correct nomenclature.**

Also notice that the description column is now automatically populated from the Tag Generator generated CSV. When Edit Tags is selected, RS5K will also show exactly where the new tags are alias to in the generic tags. The functionalities of the Tag Generator tool greatly contribute to the reduction of setup or commissioning time, ultimately reducing downtime and increasing productivity. *The import task is now completed.*

The screenshot displays the RS5K software interface. The top window, titled 'Controller Tags - EECO\_YASKAWA\_Demo(controller)', shows a table of tags. The bottom window, titled 'Monitor Tags', shows the status of the tag import task.

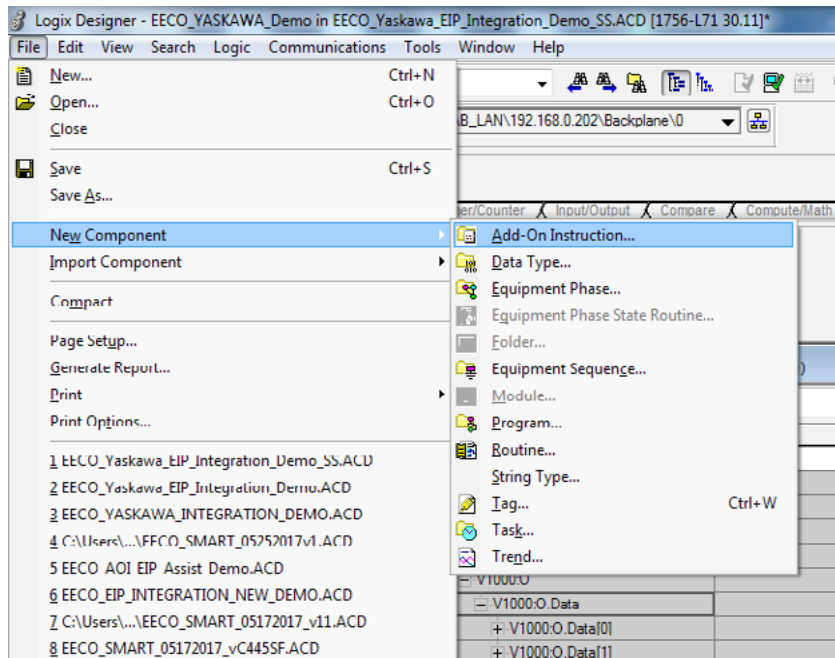

**Controller Tags Table:**

Name	Alias For	Base Tag	Data Type	Description	External Access	Constant	Style

Complete - 0 errors, 0 warnings
  
```

Yaskawa has taken additional steps to simplifying integration of its EtherNet/IP supported products by offering a wide range of VFD Add-On Instruction (AOI) in conjunction with Tag Generator. Let's proceed and explore how technicians and engineers can use Yaskawa's AOIs.

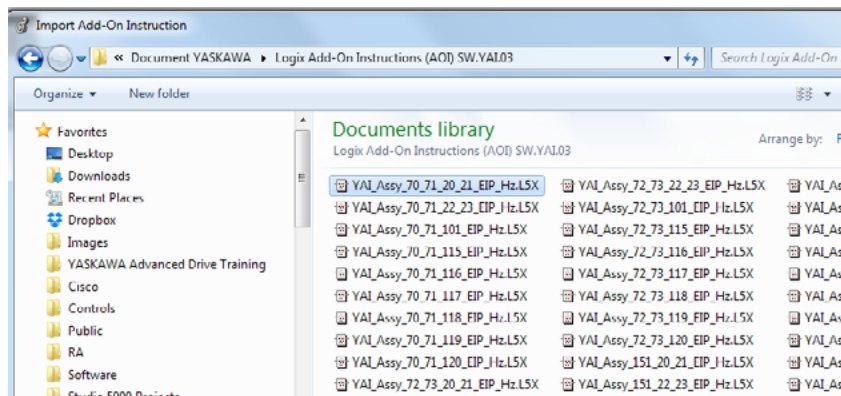

In RS5K -

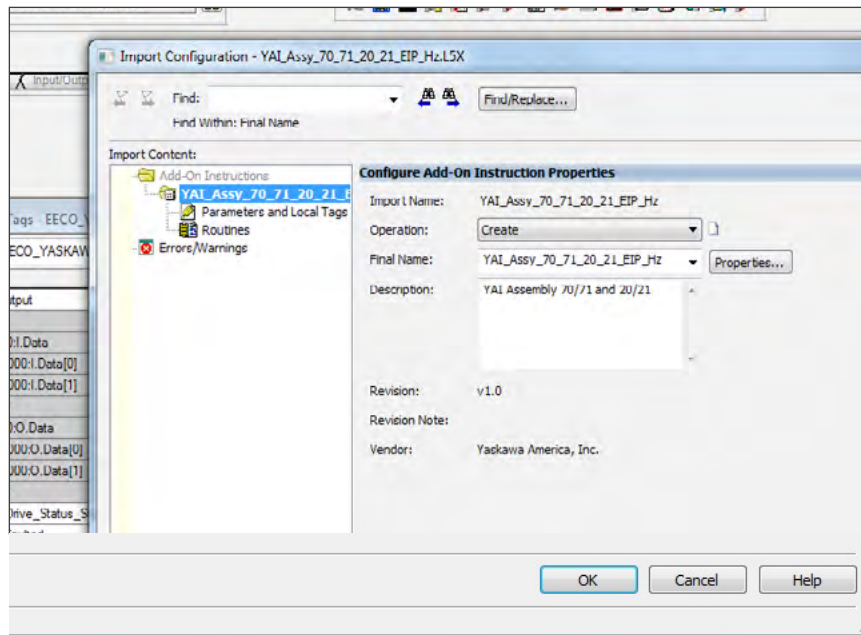

**STEP 3:** Navigate to **File > Import Component > Add-On Instruction**

**STEP 4:** Browse to the **AOI** provided by Yaskawa

The extension of the file will be a **L5X**.

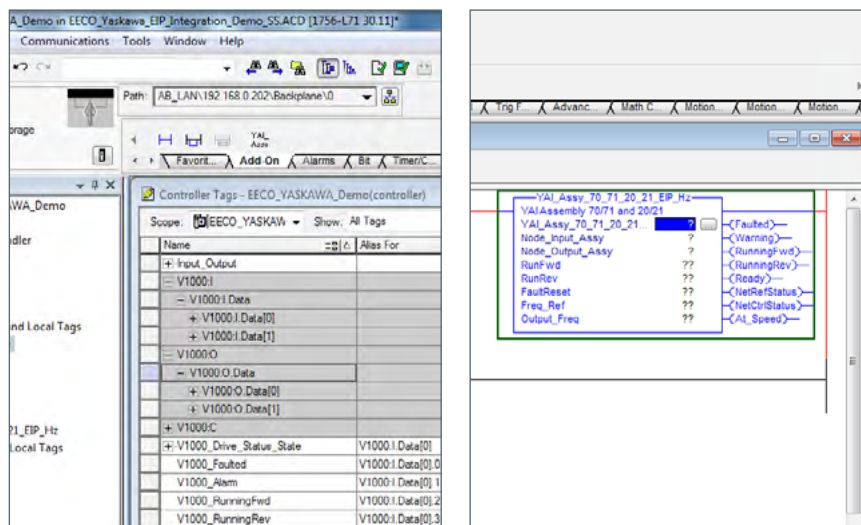

**STEP 5:** **YAI Assembly 71 21** is selected

The Import Configuration window appears.

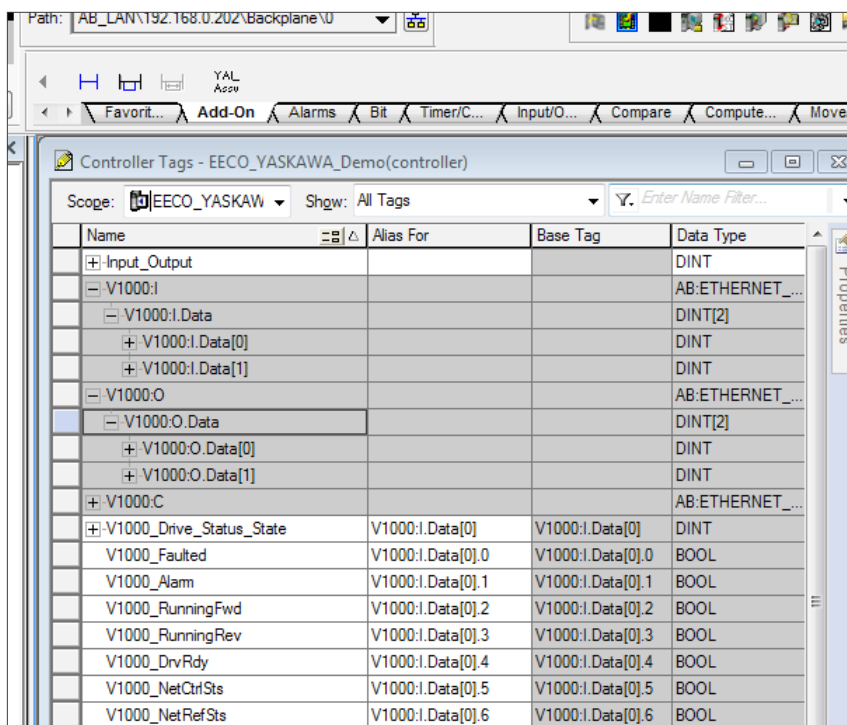

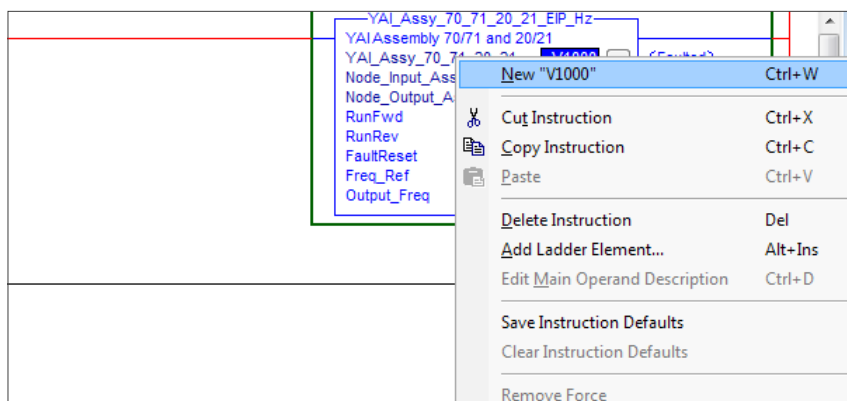

**STEP 6:** Verify and select OK

**STEP 7:** In the **Controller Organizer > Add-On Instruction**, the AOI has been successfully imported and is now available for use in the *Language Element Tool Bar > Add-On*

A solid green vertical bar positioned to the left of the text.

# UTILIZING THE **AOI**

**STEP 1:** Next, open **MainProgram – MainRoutine**

**STEP 2:** Add a rung

**STEP 3:** Then in **Add-On**, drag the V1000 AOI to the rung 0

Once the V1000 AOI block is added to the rung, the top three parameters in the AOI block must be mapped to a specific module

Within the AOI block -

**STEP 4:** Double click the **top “?”** next to the View Configuration Dialog button

**STEP 5:** Input **V1000 > right click > select “New V1000”**

**STEP 6:** A new Parameter or Tag window will appear

**STEP 7:** Confirm the name and scope

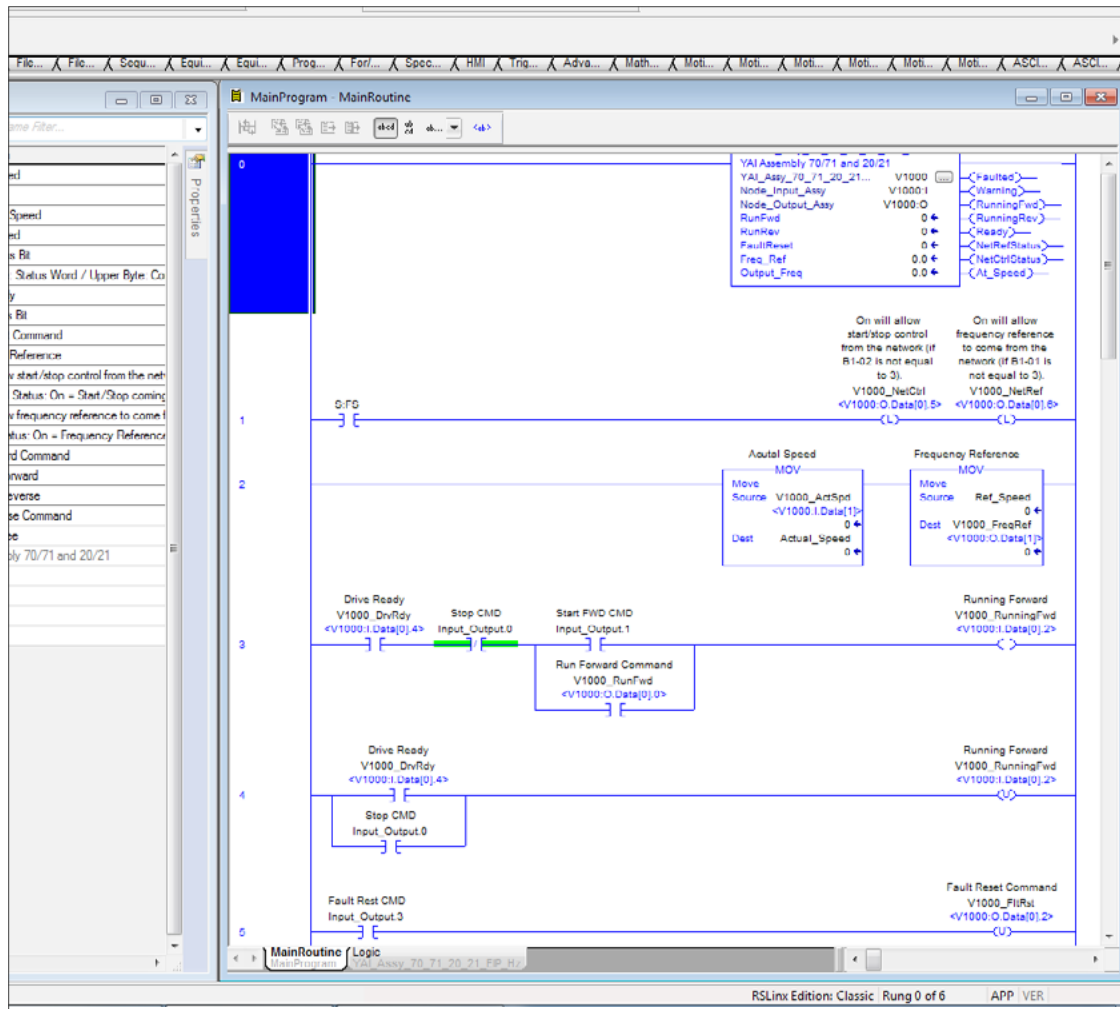

**STEP 8:** Click **create**

**Ensure that the Controller Tags and MainProgram windows are open and side-by-side.**

**STEP 9:** Select and drag **V1000:I1** to the **“?”** in the Node\_Input\_Assy row

**STEP 10:** Select and drag **V1000:O1** to the **“?”** in the Node\_Output\_Assy row

The setup of the AOI is now complete.

Let's create a **DINT** tag —

**STEP 11:** Name it **Input\_Output**.

The Boolean within the DINT will be used as logical Push Buttons.

**STEP 12:** Add a couple of rungs to the project

**STEP 13:** Enable remote FieldBus control of the **V1000** by latching the **V1000\_NetCtrl** and **V1000\_NetRef** bit

To ensure that the PLC has control after a power loss, a First Scan bit is used for latching on a power-up condition.

**STEP 14:** Add a **start**, **stop** and **fault** logic to the program,

**STEP 15:** **Download** to the processor

*The V1000 VFD is ready to be operated.* 

## MOTOR TESTING

- Page 42 of TOBPC73060092

## SPEED REFERENCE

- Speed Command
- Sets drive speed reference
- Speed reference data:  
**Frequency reference/2SS (SS: Speed scale)**
- Setting range: 0 to 0xFFFF
- Example: setting a reference of 4096 with a speed scale of 2:  
**Speed reference data =  $4096/22 = 1024 = 0x0400$  Hex or 10.24 Hz**
- Unit depends on o1-03
